

Computational Mathematics and Statistics

End Term Examination Solutions (E1PA101T)

Institution: Galgotias University

Session: Jan 2026

Program: Masters of Computer Applications (MCA)

1. Matrix Operations

Calculate the value of $10C - 3D + 5E$ given matrices C, D, and E.

$$C = \begin{bmatrix} 1 & 2 \\ 7 & 1 \end{bmatrix} \quad D = \begin{bmatrix} 11 & 4 \\ 5 & 8 \end{bmatrix} \quad E = \begin{bmatrix} 1 & 4 \\ 5 & 1 \end{bmatrix}$$

$$10C = \begin{bmatrix} 10 & 20 \\ 70 & 10 \end{bmatrix}$$

$$-3D = \begin{bmatrix} -33 & -12 \\ -15 & -24 \end{bmatrix}$$

$$5E = \begin{bmatrix} 5 & 20 \\ 25 & 5 \end{bmatrix}$$

$$\begin{aligned} \text{Result} &= 10C - 3D + 5E \\ &= \begin{bmatrix} (10 - 33 + 5) & (20 - 12 + 20) \\ (70 - 15 + 25) & (10 - 24 + 5) \end{bmatrix} \\ &= \begin{bmatrix} -18 & 28 \\ 80 & -9 \end{bmatrix} \end{aligned}$$

$$\text{Final Matrix} = \begin{bmatrix} -18 & 28 \\ 80 & -9 \end{bmatrix}$$

2. Standard Deviation

Series: 3, 6, 8, 10, 12, 14

$$\text{Mean } (\bar{x}) = (3+6+8+10+12+14) / 6 = 53 / 6 \approx 8.83$$

Deviations $(x - \bar{x})^2$:

$$(3 - 8.83)^2 = 34.03$$

$$(6 - 8.83)^2 = 8.01$$

$$(8 - 8.83)^2 = 0.69$$

$$(10 - 8.83)^2 = 1.37$$

$$(12 - 8.83)^2 = 10.05$$

$$(14 - 8.83)^2 = 26.73$$

Sum of Squares = 80.88

Variance = $80.88 / 6 = 13.48$

Standard Deviation = $\sqrt{13.48} \approx 3.67$

3. Conditional Probability

Definition: The probability of an event occurring given that another event has already occurred.

Problem: $P(\text{Science}) = 4/5$, $P(\text{Science} \cap \text{Maths}) = 1/2$. Find $P(\text{Maths} | \text{Science})$.

Formula: $P(B|A) = P(A \cap B) / P(A)$

$$P(\text{Maths} | \text{Science}) = (1/2) / (4/5)$$

$$= (1/2) * (5/4)$$

$$= 5/8 \text{ (or } 0.625)$$

4. Central Limit Theorem (CLT)

Theorem: As sample size increases, the distribution of sample means approaches a normal distribution, regardless of the population's distribution.

Problem: $\mu = 1000$, $\sigma = 100$, $n = 36$. Find $P(980 < \bar{x} < 1020)$.

$$\text{Standard Error (SE)} = \sigma / \sqrt{n} = 100 / \sqrt{36} = 16.67$$

Z-scores for 980 and 1020:

$$Z = (980 - 1000) / 16.67 = -1.2$$

$$Z = (1020 - 1000) / 16.67 = 1.2$$

$$P(-1.2 < Z < 1.2) = \mathbf{0.884} \text{ (as given)}$$

5. Discrete Probability Distributions

Find k for $f(x) = k(x^3 + 1)$ for $x = 1, 2, 3, 4$.

$$\text{Sum of } f(x) = 1$$

$$k[(1^3+1) + (2^3+1) + (3^3+1) + (4^3+1)] = 1$$

$$k[2 + 9 + 28 + 65] = 1$$

$$k[104] = 1$$

$$\mathbf{k = 1/104}$$

$$\begin{aligned} \text{Mean } (E[X]) &= \sum x * f(x) = (1*2 + 2*9 + 3*28 + 4*65) / 104 \\ &= (2 + 18 + 84 + 260) / 104 = 364 / 104 \approx \mathbf{3.5} \end{aligned}$$
